

## IN THE CLAIMS

Please amend the claims as follows:

1. (original) Imaging module (1), comprising:

- a lens holder (50) holding a lens (20);
- a foot (30) holding an image sensor chip (10); and
- detachable locking means (37, 55) for fixing a mutual position of the lens holder (50) and the foot (30) with respect to each other in at least one direction.

2. (original) Imaging module (1) according to claim 1, wherein the locking means (37, 55) are designed such as to bring about a snap connection between the lens holder (50) and the foot (30) on a movement of the lens holder (50) and the foot (30) with respect to each other in the at least one direction.

3. (currently amended) Imaging module (1) according to claim 1 ~~or~~ 2, wherein the locking means comprise at least one rib (37), provided on one of the foot (30) and the lens holder (50), as well as at least one slot (56) for receiving and retaining the rib (37), provided in another of the foot (30) and the lens holder (50).

4. (currently amended) Imaging module (1) according to ~~any of~~  
~~claims 1-3~~claim 1, further comprising coupling means (35, 52) for  
coupling the lens holder (50) and the foot (30), wherein the  
coupling means (35, 52) are designed such as to bring about a  
movement of the lens holder (50) with respect to the foot (30) in  
an axial direction on rotation of the lens holder (50) and the foot  
(30) with respect to each other.

5. (original) Imaging module (1) according to claim 4, wherein  
the locking means (37, 55) are designed such as to prohibit a  
rotation of the lens holder (50) and the foot (30) with respect to  
each other.

6. (currently amended) Imaging module (1) according to claim 4 ~~or~~  
~~5~~, wherein the locking means (37, 55) are designed such as to allow  
a movement of the lens holder (50) and the foot (30) with respect  
to each other in an axial direction.

7. (currently amended) Imaging module (1) according to ~~any of~~  
~~claims 4-6~~claim 4, wherein the coupling means comprise a flange  
(35) on the foot (30) as well as a flange (52) on the lens holder  
(50), wherein both flanges (35, 52) comprise a contact surface (36,

53), and wherein the contact surfaces (36, 53) are destined to abut against each other.

8. (original) Imaging module (1) according to claim 7, wherein the contact surface (36, 53) of at least one of the flanges (35, 52) is inclined with respect to a plane extending perpendicular to an axial direction.

9. (currently amended) Imaging module (1) according to ~~any of claims 1-8~~claim 1, further comprising pressing means (60) for pressing the lens holder (50) and the foot (30) in an outward axial direction with respect to each other, the pressing means preferably comprising a helical spring (60).

10. (currently amended) Cellular phone, comprising an imaging module (1) according to ~~any of claims 1-9~~claim 1.
